Reproducibility

Reproducibility I

The project avoids external image services and live APIs. Page images are procedurally generated from checked-in content, and the final PDF is assembled from those generated images. Tests check that the story loads, the two central characters have opposite family shapes, a page renders at the configured dimensions, the PDF page count matches the content file, and at least one page script can run against a temporary project root.

The generated manifest records the cast, page list, and render paths. That manifest is the compact evidence surface for the primary artifact.
