The fixture release packet shows how invented high-side markers are redacted before a public narrative is generated. The public export contains redacted text only, paragraph audit rows, release authority metadata, source-safe ledger hashes, review-gate status, and residual-marker findings for review; it does not contain operational source text beyond invented fixture residue used by tests.

The development proof matrix produces sixteen visual PDFs and, when steganography is enabled, sixteen companion provenance PDFs with hash sidecars. The matrix also records Kmyth runtime status and `.ski` sidecar counts so TPM sealing is evidenced as an observed output rather than a prose claim. This confirms that visual presentation choices remain orthogonal to the release gate: the same source-safe decisions drive every blackout, whiteout, grayout, blur, white-background, gray-background, black-background, and blur-background output.
